

Temporal memory pyramid

An eight-hour shift is ~1.7M tokens of raw observation. An operator asking "what happened last night" expects an answer grounded in all of it.

SALIENCE-WEIGHTED — COMPRESSION IS NOT UNIFORM

A quiet shift

1,240 frames · nothing happened

→ one sentence

"Perimeter quiet 22:00–06:00; two authorised vehicles at the gate."

Four minutes around an intrusion

48 frames · a person at the fence line

→ frame-level detail retained

Uniform summarisation would discard precisely the material an investigation needs.

WHAT RAISES SALIENCE

a person present
+0.25

high-priority zone
+0.30

night hours
+0.15

three or more objects
+0.10

Ordering by salience means truncation drops the least important material, not the most recent.
